Sulfolobus acidocaldarius strain ATCC 33909. Thermostable enzyme; trehalose; sweetener. Trehalose-releasing thermostable enzyme. (HAYB) HAYASHIBARA SEIBUTSU KAGAKU. AA. AAR92755 standard; Protein; 556 95JP-0189760. 94JP-0190180. 95JP-0109128. 95AU-0027131. (first entry) 04-JUL-1995; 21-JUL-1994; 11-APR-1995; 21-JUL-1995; 03-AUG-1996 AU9527131-A. 01-FEB-1996. AAR92755; AAR92755

Sugimoto Kubota M, Mitsuzumi H, WPI; 1996-106284/12. N-PSDB; AAT16899.

Recombinant thermostable enzyme from Sulfolobus acidocaldarius, releases trehalose from non-reducing saccharide at temps, exceeding 55 degrees Centigrade

                        A thermostable enzyme (AAR92755) of Sulfolobus acidocaldarius ATCC 33909 releases trehalose from non-reducing saccharides having a trehalose structure as an end unit and a degree of polymerisation of at least 3. It has a mol.wt. of 54.64 kps (SDS-PAGE), a pl of 5.6-6.6 and is substantially not inactivated when incubated in acolution (pH 7.0) at 85 deg for 60 min. Recombinant enzyme is obtd. by expression of an isolated DNA fragment (AAT16899) in host cells, pref. Escherichia coli, using e.g. vector pBluescript II SK(+). The trehelose is useful as a sweetener.
                                                                                                                                                                         Gaps

The amylase is derived from Sulfolobus acidocaldarius. The amylase acts on a saccharide having at least three sugar units, which are prefigurose units at the reducing end (the linkage between the first and second glucose units is alpha-1, alpha-1, while the linkage between the second and third glucose units is alpha-1, while the linkage between the linkages within the sugar chain, yielding alpha, alpha-trehalose and also mono- and disaccharide hydrolysis products. The amylase has a mol. wt. of 61 to 64 kDa. It is characterised by working at pH 4.5-5.5 and at 60-85 deg.C. It has an isoelectric point of 4.3-5.4 and retains at least 100 percent activity after 6 hrs. at 80 deg.C. It is completely inhibited by 5 mM copper sulphate. Use of a transferase and the amylase in succession on suitable substrates such a malto-oligosaccharides, is useful for the production of alpha, alpha-trehalose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GDLPPRKFVVFIQNHDQVGNRGNGERLSILTDKTTYLMAATLYILSPYIPLIFMGEEYYE 420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The amylase is derived from Sulfolobus solfataricus. The amylase acts on a saccharide having at least three sugar units, which are prefigurose units at the reducing end (the linkage between the first and second glucose units is alpha-1, alpha-1, while the linkage between the second and third glucose units is alpha-1, 4), to hydrolyse alpha-1, 4 linkages within the sugar chain, yielding alpha, alpha-trehalose and also mono- and disaccharide hydrolysis products. The amylase has a mol. wt. of 61 to 64 kDa. It is characterised by working at pH 4.5-5.5 and at 60-85 deg.C. It has an isoelectric point of 4.3-5.4 and retains at least 100 percent activity after 6 hrs. at 80 deg.C. It is completely inhibited by 5 mw copper sulphate. Use of a transferase and the amylase in succession on suitable substrates such a malto-oligosaccharides, is useful for the production of alpha, alpha-trehalose.

                                                                                                                                                                                                                                                                                                                 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, coryneform bacterium, coryneform bacterium, coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacteria are useful for producing amino acids, nucleic acids, vitemins, saaccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13;
                                                                Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     188 DVVYNHIGPEGNYLLGLGPYFSDRYKTPWGLTFNFDDRGCDQVRKFILENVEYWFKTFKI 247

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This enzyme can be used for the preparation of trehalose with high yields and efficiency from non-reducing saccharides such as alpha glucosyltrehalose, alpha-maltotirehalose, alpha-maltoterrasyltrehalose and maltopentaosyltrehalose. The trehalose can be used as sweetener, taste-improving agent, quality-improving agent, stabiliser, filler, exciplent or adjuvant in food products cosmetics and pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     66 EIPDPASRYQPLGVHDKSQLIRTDYQILDLGKVKIEDL------IIYELHVGTFSQ 115

This enzyme can be used for the preparation of trehalose with high yields and efficiency from non-reducing saccharides such as alpha-glucosyltrehalose, alpha-maltosyltrehalose, alpha-maltotetrasyltrehalose and maltopentacosyltrehalose. The trehalose can be used as a sweetener, taste-improving agent, quality-improving agent, stabiliser, filler, excipient or adjuvant in food products cosmetics and pharmaceuticals.
                                                                                            trehalose; alpha-glucosyltrehalose; alpha-maltosyltrehalose;
                                                                                                         alpha-maltotriosyltrehalose; alpha-maltotetrasyltrehalose;

                                                                                                                                                                                                                                       This enzyme can be used for the preparation of trehalose with high yields and efficiency from non-reducing saccharides such as alpha-glucosyltrehalose, alpha-maltotsyltrehalose, alpha-maltottriosyltrehalose. The translote used as a sweetener, maltopentaosyltrehalose. The trehalose can be used as a sweetener, taste-improving agent, quality-improving agent, stabiliser, filler, excipient or adjuvant in food products cosmetics and pharmaceuticals.

This sequence represents a trehalose-releasing enzyme amino acid sequence from Arthrobacter sp. 534. This enzyme specifically hydrolyses a non-reducing saccharide having a trehalose structure as an end unit. The invention relates to this enzyme and also to a non-reducing saccharide forming enzyme that forms a non-reducing saccharide having a trehalose structure as an end unit by reducing partial starch hydrolysates. The two extracture as an end unit by reducing partial starch hydrolysates. The two moles of glucose bound at their reducing residues. The disaccharide is substantially free of reducibility and has moisture retaining abilities. The enzymes are used to produce non-reducing sugars they are particularly used for further enzymatic conversion of starch hydrolysate to trehalose. The non-reducing sugars produced by the enzymes are useful in foods, pharmaceuticals and cosmetics. Non-reducing sugars are compatible with anino acids and proteins, they do not cause browning, and have good moisture-retaining properties. The enzymes broduce the non-reducing sugars in high yield and function at a medium temperature range 1.e. between 40 degrees celsius and 60 degrees celsius, and in an acidic pH range, 1.e. a pH of less than 7. Production of non-reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          abilities. The enzymes are used to produce non-reducing sugars, they are particularly used for further enzymatic conversion of starch hydrolysate to trehalose. The non-reducing sugars produced by the enaymes are useful in foods, pharmaceuticals and cosmetics. Non-reducing sugars are compatible with amino acids and proteins, they do not cause browning, and have good moisture-retaining properties. The enzymes produce the non-reducing sugars in high yield and function at a medium temperature range i.e. between 40 degrees celsius and 60 degrees celsius, and in an sugars using the enzymes eliminates the need to convert a starch hydrolysate into sugar alcohols (non-reducing) by catalytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10;
                                                                                                                                                                                                                                                                                                                               from Arthrobacter sp. S34. This enzyme specifically hydrolyses a non-reducing saccharide having a trehalose structure as an end unit. The invention relates to this enzyme and also to a non-reducing saccharide forming enzyme that forms a non-reducing saccharide having a trehalose structure as an end unit by reducing partial starch hydrolysates. The two enzymes can be used to produce trehalose, a disaccharide consisting of two moles of glucose bound at their reducing residues. The disaccharide is substantially free of reducibility and has moisture retaining
                                                                                                                                                                                                                                                                                                               This sequence represents a trehalose-releasing enzyme amino acid sequence
                                                                                                                                                                        New mesophilic enzyme from Arthrobacter, used to convert starch hydrolysate into non-reducing sugars, particularly trehalose, useful as a sweetener in foods, pharmaceuticals and cosmetics -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              71 ASRYQPLGVHDKSQLIRTDYQILDLGKV--------KIEDLIIYELHVGTFS 114

This sequence represents a thermostable starch- branching-enzyme (Q-enzyme, EC-2.4.1.8) from Bacillus stearchermophilus TRBE14 (FERM P-13916). Conserved regions present in amylases are used to construct primers AAT27126-7, which are used in PCR to amplify a fragment of the gene, which is then used as a probe to isolate a full-length clone in Escherichia coli. The recombinant enzyme may be reacted with starch or amylopectin to produce a glucan with a degree of polymerisation of at least 50, with an inner branched cyclic region and an outer branched region. The product is freely soluble in water, forming a low-viscosity solution, is more resistence to degradation than native starch, does not react with proteins and amino acids, and is degraded to glucose in vivo, so is easily digestible. The glucan may be used in foods, beverages, food-additives, adhesives, in cyclodextrin production and as a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This branching enzyme is derived from B.stearothermophilus and is encoded by the glgB gene. It is stable at high temps. and can be produced in large amts. using recombinant techniques. It is a transferase allowing formation of alpha(1-6) branches in starch-like substances. It is useful for extending the shelf life of such materials and can be used in the prepn. of human and animal foods.

No. 174037/88) was cleaved by various restriction enzymes and inserted into plasmid pV118/119. Single-stranded DNA was prepd. using helper phage M13K07 and the base sequence determined by the dideoxy method.

Patent No. 5856146
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MITSUGUNI, Hitoshi
APPLICANT: KUBOTA, Michio
APPLICANT: SUGIMOTO, Toshiyuki
TITLE OF INVENTION: RECAMBINANT THERMOSTABLE ENZYME WHICH
TITLE OF INVENTION: RELEASES TREHALOSE FROM NON-REDUCING SACCHARIDE
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
                                                                                                                                                                          Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Seq

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
